HOME IMPLEMENTATION

- Auto-complete search bar implemented with **Google Place Autocomplete API**
- RecyclerView displaying nearby places
- Nearby places are fetched with **Google Nearbysearch API** based on user preferences
- Radius set to 1500m centered at the current location
- AlertDialog to display place detail
- Once a destination is selected
Navigate to **Exploration** page
NavArg: destination ID passed using safeargs

EXPLORATION PAGE IMPLEMENTATION

- Auto-complete search boxes
- Current location button
- MapView
- Place Dialog

EXPLORATION PAGE IMPLEMENTATION

- Autocomplete Search Box
 - Autocomplete search boxes for start point and destination
- Current location button
 - Gets user's current location using FusedLocationProviderClient from Google Play Services (balanced power and accuracy)
- MapView
 - Get Directions
 - Gets the route between the start point and the destination based on the user's preferred travel mode set in Personal Profile
 - Get Recommended Places
 - For each coordinate on the route that are 2 km apart from each other, get the places of user's interest (from Personal Profile) within 1 km radius (location bias) of that coordinate
 - Place Dialog
 - Allows user to view details regarding the place (name, address, rating and image)
 - Allow users to add and remove places of interest to add to itinerary
 - Send the details to itinerary after they are done
 - **Navigate** to Itinerary page (args: Itinerary ID received from POST response)

DASHBOARD TAB IMPLEMENTATION

- RecyclerView of itinerary history
- How data fetched:
 - HTTP request to backend application running in an AWS EC2 instance

Itinerary History

Itinerary1

FROM [Your Location]
TO [655 Commonwealth Ave]

Itinerary2

FROM [Soldiers Field Road]
TO [655 Commonwealth Ave]

Itinerary3

FROM [Soldiers Field Road]
TO [655 Commonwealth Ave]

Itinerary4

FROM [655 Commonwealth Ave]
TO [Red Leaf Café]

Itinerary5

FROM [Your Location]
TO [900 Commonwealth Ave]

Itinerary6

FROM [89 E Dedham St]
TO [900 Commonwealth Ave]

ITINERARY DETAIL PAGE IMPLEMENTATION

- **Display:** RecyclerView
- **Features:**
 - Shows an optimized route to travel in the shortest time in real time
 - Shows time taken and direction information from one place to its next place
- **Fetching data:** HTTP request to the backend application
- **Optimized route calculation:**
 - Calculate 2D distance matrix, value inside is the time from one place to another
 - Use the matrix with Google MAP TSP Solution to get optimized order to travel
- **Direction:**
 - Google Map Direction API

CHATGPT USAGE:

- For Android app:
 - Asked it how to change from a traditional RecyclerView development method to a newer version of development for RecyclerView
- For Backend:
 - Asked it how to use: Google Map Distance Matrix API, Direction API, some python commands, and some operations of using SQLAlchemy

☰ README.md ✎

PopUpTrip

PopUpTrip is an Android travel planning app that simplifies the process of organizing trips and discovering nearby attractions. With the help of this app, users can easily create itineraries and explore the area around them.

Features

- User authentication with sign-in and sign-up functionality.
- User authentication with reset password and profile data migration functionality.
- Customize your experiences based on your preferences under personal profile.
- Travel history and user preferences are stored in a cloud database associated with the user account.
- Discover nearby attractions and points of interest using the integrated Google Maps API.
- Create your travel itineraries with an easy-to-use interface.
- Optimize itineraries' travelling time to allow users to travel the places they want to in the shortest time.
- Get detailed information about places, such as ratings, photos, and descriptions.
- Search for specific locations using the autocomplete search feature.
- Receive real-time updates on nearby attractions as you move around.

Installation
